| <b>Maximum Marks</b> | 2 Marks                                                          |

### Data Flow Diagram

The **Data Flow Diagram (DFD)** illustrates how weather data flows through the **Flood Prediction System** between users, the prediction engine, machine learning model, and data storage components to generate flood risk predictions.

| Symbol             | Name            | Description                                                                                      |
|--------------------|-----------------|--------------------------------------------------------------------------------------------------|
| Oval               | External Entity | User / Disaster Management Authority interacting with the system.                                |
| Numbered Rectangle | Process         | Processes weather data and predicts flood occurrence.                                            |
| Solid Rectangle    | Data Store      | Stores historical weather dataset, trained ML model, and prediction results                      |
| Arrow              | Data Flow       | Represents the movement of weather information and prediction results between system components. |
